Re: Sundance Ft St John 6-36-83-18 W6  
Fort St John - North Pine 'C' Pool

The Petroleum Resources Division has completed a detailed geological and engineering review of the North Pine wells in the Fort St John and Cecil area. Based on the results of this review the wells Murphy Ft St John 6-31-83-17 and Sundance Ft St John 6-36-83-18 are now interpreted as being located in a separate oil pool designated as the Fort St John North Pine 'C' pool.

We wish to advise that a concurrent production scheme with oil and gas allowable has been approved for Section 31-83-17 and that we would be prepared to approve an application to include Section 36-83-18 into this scheme. Such an approval would be subject to the following conditions:

1. The area of concurrent production would consist of Section 36-83-18 W6.
2. The oil allowable for the spacing area would be *(present DOA 7.8)* 5.6 m<sup>3</sup>/d.
3. The daily gas allowable would be 6.6 10<sup>3</sup> m<sup>3</sup>/d based on volumetric reserves assessed for the spacing area.
4. Gas production would be conserved.

1.6

We look forward to your application to join the concurrent production scheme in the Fort St John North Pine 'C' oil pool.

Yours truly,

PETROLEUM RESOURCES DIVISION
