

APPLICATION GUIDELINE FOR: DEEP WELL DISPOSAL OF PRODUCED WATER DEEP WELL DISPOSAL OF NONHAZARDOUS WASTE

Well Type	Waste Types Allowed	Required Approval
Produced Water Disposal	Produced water, completion fluids including recovered frac water	OGC Special Project
Non-Hazardous Waste Disposal	Completion fluids including recovered frac water, boiler blowdown water, tank wash water, rig wash, spent glycols, drilling waste leachate, as well as produced water.	OGC Special Project & EMA Permit

Produced water from oil and gas wells must be disposed into a subsurface formation via an approved disposal service well, as per Section 7(1) of the Oil and Gas Waste Regulation. Produced water is defined to also include recovered fluids from well completion or workover operations (including flowback fluids from fracture stimulations); therefore this application/approval applies for disposal of water associated with hydrocarbon production, flowback fluids, or a combination of both.

Non-hazardous waste generated from oil and gas industry activities may be disposed into deep formations. Non-hazardous (formerly termed non-special) waste covers waste materials that are not classified as "hazardous" under the Hazardous Waste Regulation. Examples of non-hazardous wastes that may be disposed include boiler blowdown water, tank wash water, rig wash, spent glycols, drilling waste leachate, etc. If an operator will only be using the disposal well for fluids generated by their own operations, the Commission's Waste Management and Reclamation Branch handle the EMA (Environmental Management Act) Permit. If the facility is to handle 3rd party wastes, the Ministry of Environment administers the permit under the EMA.

Detailed information regarding water service wells can be found on the Commission website here: <u>Summary information</u> <u>Water Source and Disposal Wells</u>. A proposal to dispose into a deep water-saturated formation must be shown to have no adverse effects on hydrocarbon potential or usable water in the surrounding area. A proposal to use a depleted pool must demonstrate containment.

An application for disposal well approval, as a Special Project under Section 75 of the Oil and Gas Activities Act should contain, when applicable:

GENERAL INFORMATION

Well permit number, well name and location (surface and bottom, if different) of the proposed disposal well. Indicate if the well is deviated or horizontal.

Discussion and justification for disposal of produced water in the proposed well at the selected location, as expanded below.

WELL CHRONOLOGY

Chronological summary of well events including drilling, rig release, completion and activity history. Include any production and re-completion, logging or testing work to prepare the disposal zone. Specify dates, durations, depths and outcomes as well as indicating which section of the application contains the test results. Table format preferable.

Report of the disposal-well completion, including; wellbore schematic, existing and new completion intervals
squeeze details, casing and tubing details and packer depth.

CASING, CEMENTING AND HYDRAULIC ISOLATION

	Full length casing inspection log, rec disposal service. Include log interpre changes since conducted.	quired for any <u>existing well</u> greater etation. A recent log may be suital	than 10 years old being converted for ble if well has not undergone significant
	Cement integrity/inspection logs (rac pass and pressure pass) – less than	dial log displaying 3' amplitude, 5' 10 years old.	/DL and cement map with non-pressure
	Evidence of hydraulic isolation of the by operator.	e disposal zone, typically a temper	ature log. Alternatives may be proposed
	Before disposal operations begin, a requirement when any completion or must be pressure tested to a minimu injection or disposal operations. (Se suspended wells and for suspending vary by more than three per cent dur but is not the same requirement as t	pressure integrity test is required. r workover is conducted on a well. um pressure of 7,000 kPa for 10 m ee the <u>Oil and Gas Activity Operati</u> g wells). A pressure test is considering the test period. This pressure he annual packer isolation test.	This is standard pressure testing The casing or casing/tubing annulus inutes prior to the commencement of ons Manual requirement for activating ered successful if the pressure does not test is required before disposal begins
	Table of surface casing vent flow (So 12 months.	CVF) test history including test dat	es and results. Must have tested in past
	Type of inhibitor fluid in annulus.		
	Map illustrating the status, completic	on zones for all wells within three k	ilometers of the disposal well.
	Table listing wellbores within three k pressures. Order table by proximity intersecting the disposal formation in	m radius detailing casing age, OD to disposal location. The maximum the area must be considered.	, grade, weight, collapse and burst n collapse strength of wellbores
GEOL	.OGY		
	Discussion of the relevant geology a	and rock properties of the reservoir	formation. Include:
	average porosity	permeability	water saturation
	gas-oil contact	gas-water contact	oil-water contact
	Cross-sections, structural contour ar	nd isopach maps with details of top	and base of pay and net pay.
	Reservoir seals - discussion of the and thickness, evidence of fracturing	reservoir bounding base and cap g and effective pool boundaries.	ock, including; rock properties, continuity
	• Include caprock formation fr	acture pressure, if available	
	Aquifer details - stratigraphic traps, o	dip and strike and estimates of the	volume and areal extent of the aquifer.
	D Maps showing known faults within 20 showing structures and faulting for the	0 km of the proposed disposal loc he area.	ation. Include 2 or 3-D seismic mapping,
	Any noted seismicity within a 20 km information.	radius. Natural Resources Canac	a website is one source for this
	Discuss core sample and image log	with respect to natural fractures,	

RESERVOIR

If depleted pool, include the producing history of the proposed disposal well and other wells in pool. As well, address remaining reserves, economic factors and rationale for pool selection.
Initial reservoir pressure, citing data source, dates and calculations to convert to depth of disposal well.
Proposed wellhead & bottom hole injection pressure, and formation fracture pressure (based on ISIP).
Detailed report of one of the following:
Step-rate injectivity test performed to ascertain fracture pressure of the formation. Must conform to test methods as outlined in <u>Alberta Energy Regulator Directive 65 Appendix O</u> .
Mini-frac or DFIT stimulation of proposed well. Determine and interpret ISIP. Calculation of maximum allowable wellhead injection pressure will include bottom hole ISIP, hydrostatic head, friction losses and a safety factor.
Expected injectivity performance (rate and injection pressure) and life, based on maximum limiting average reservoir pressure value (120 per cent of Pi) and available voidage capacity.
Results of production testing for hydrocarbon potential in the proposed disposal zone
Analysis of water in the disposal formation and typical analysis of the water to be disposed. Included description of sources and compatibility.
Source of fluids to be disposed
Proposed well testing schedule to monitor reservoir pressure in the disposal formation.
FACILITES AND MEASUREMENT
Identify method/type/facility for metering of injection fluid and continuous measurement and recording of wellhead injection and casing pressures.
Identify method/type/facility for metering of injection fluid and continuous measurement and recording of wellhead injection and casing pressures. GROUNDWATER
 Identify method/type/facility for metering of injection fluid and continuous measurement and recording of wellhead injection and casing pressures. GROUNDWATER Base of groundwater depth, using the methodology outlined in INDB 2016-09 Technical Guidance for Determining the "Base of Usable Groundwater"
 Identify method/type/facility for metering of injection fluid and continuous measurement and recording of wellhead injection and casing pressures. GROUNDWATER Base of groundwater depth, using the methodology outlined in INDB 2016-09 Technical Guidance for Determining the "Base of Usable Groundwater" Discussion of fresh water wells within three km. Applicants can use the <u>BC OGC Groundwater Review Assistant</u> tool to provide details about groundwater aquifers, fresh water wells, capture zones, and more.
 Identify method/type/facility for metering of injection fluid and continuous measurement and recording of wellhead injection and casing pressures. GROUNDWATER Base of groundwater depth, using the methodology outlined in INDB 2016-09 Technical Guidance for Determining the "Base of Usable Groundwater" Discussion of fresh water wells within three km. Applicants can use the <u>BC OGC Groundwater Review Assistant</u> tool to provide details about groundwater aquifers, fresh water wells, capture zones, and more. NOTE: Pro-active monitoring of penetrated shallow aquifers is recommended practice, though not required at present, and it is advisable to include a monitoring plan in the application.

IF AMENDMENT APPLICATION

TENURE (Mineral)

Map illustrating mineral tenure and registered owners, in the disposal formation, within a 3-kilometre radius of the proposed disposal well.

LETTERS

Provide written statements from subsurface tenure owners who may be affected, indicating their reaction to the proposed water-disposal scheme. Examples of such statements are provided here <u>Consent to Inclusion in a Reservoir</u> <u>Project</u> or here <u>No Objection to Reservoir Project</u>.

<u>Two</u> copies of the application are to be submitted to the Supervisor of the Reservoir Engineering Department of the Oil and Gas Commission in Victoria at the mailing address, or by courier at the physical office address (see <u>Office Address</u> <u>Directory</u> for physical and mailing address). Notice of an application is posted on the <u>Commission's website</u> for a 21-day period to solicit any potential technical objection. The applicant is responsible for providing a copy of the application, upon request, to third parties during the period of public notice. After the notice period ends, a copy of the application may be requested by the <u>Commission's Data Centre</u>.

A third copy, is to be forwarded to the Supervisor, Drilling & Production of the Oil and Gas Commission in Kelowna (see <u>Office Address Directory</u> for mailing address). <u>Notice of Operations</u> form must be entered through the OGC Online Drilling Reporting System at least 24 hours before workover operations begin.

NON-HAZARDOUS WASTE

If the non-hazardous waste application is only for the applicant's disposal product, please send the application to the Director, Waste Management & Reclamation of the Operations Division of the Commission in Fort St. John (see <u>Office</u> <u>Address Directory</u> for mailing address).

If non-hazardous waste products will contain 3rd party waste, send the following to the Oil and Gas Authorizations Section Head, Ministry of Environment, Suite 325, 1011 Fourth Avenue, Prince George, BC, V2L 3H9.

Source of fluids to be disposed

For non-hazardous waste, a waste characterization sheet detailing the waste name, general description of how or where the waste is generated and contaminants it may contain.

The Ministry of Environment information on waste discharge authorizations is available here.
